

Interplay between **microRNAs**, **Transcription Factors**, and **Target Genes**: Linking Dynamic Expression Changes to Function

Petr Nazarov

23-07-2013

Nazarov, Reinsbach et al. Nucleic Acids Res. **2013**, 41(5):2817-31

- ◆ Small, non-coding RNAs (~22 nt)
- ◆ Negative post-transcriptional regulators
- ◆ Pre-miR → 2 **strands**, historically called **guide** and **passenger** strands. However passenger may be of **equivalent importance**.
- ◆ Involved in many cellular processes and diseases. ~ 60% of genes are regulated by miRNAs.
- ◆ Roles in cancer:
 - tumour-suppressing miRNAs (miR-15a)
 - oncogenic miRNAs (miR-21)

Canonical miRNA production. Adapted from Winter, Nat.Cell Biol. 2009

Reinsbach, et al.(2012) RNA Biology

- ◆ miRNAs are short and in principle may be not entire complementary to target gene mRNA sequence. This hampers prediction of target gene, and results in a high level of FPs.
- ◆ miRNA expression depends on cell type and biological condition.
- ◆ Precise mechanisms of miRNA actions are debated.

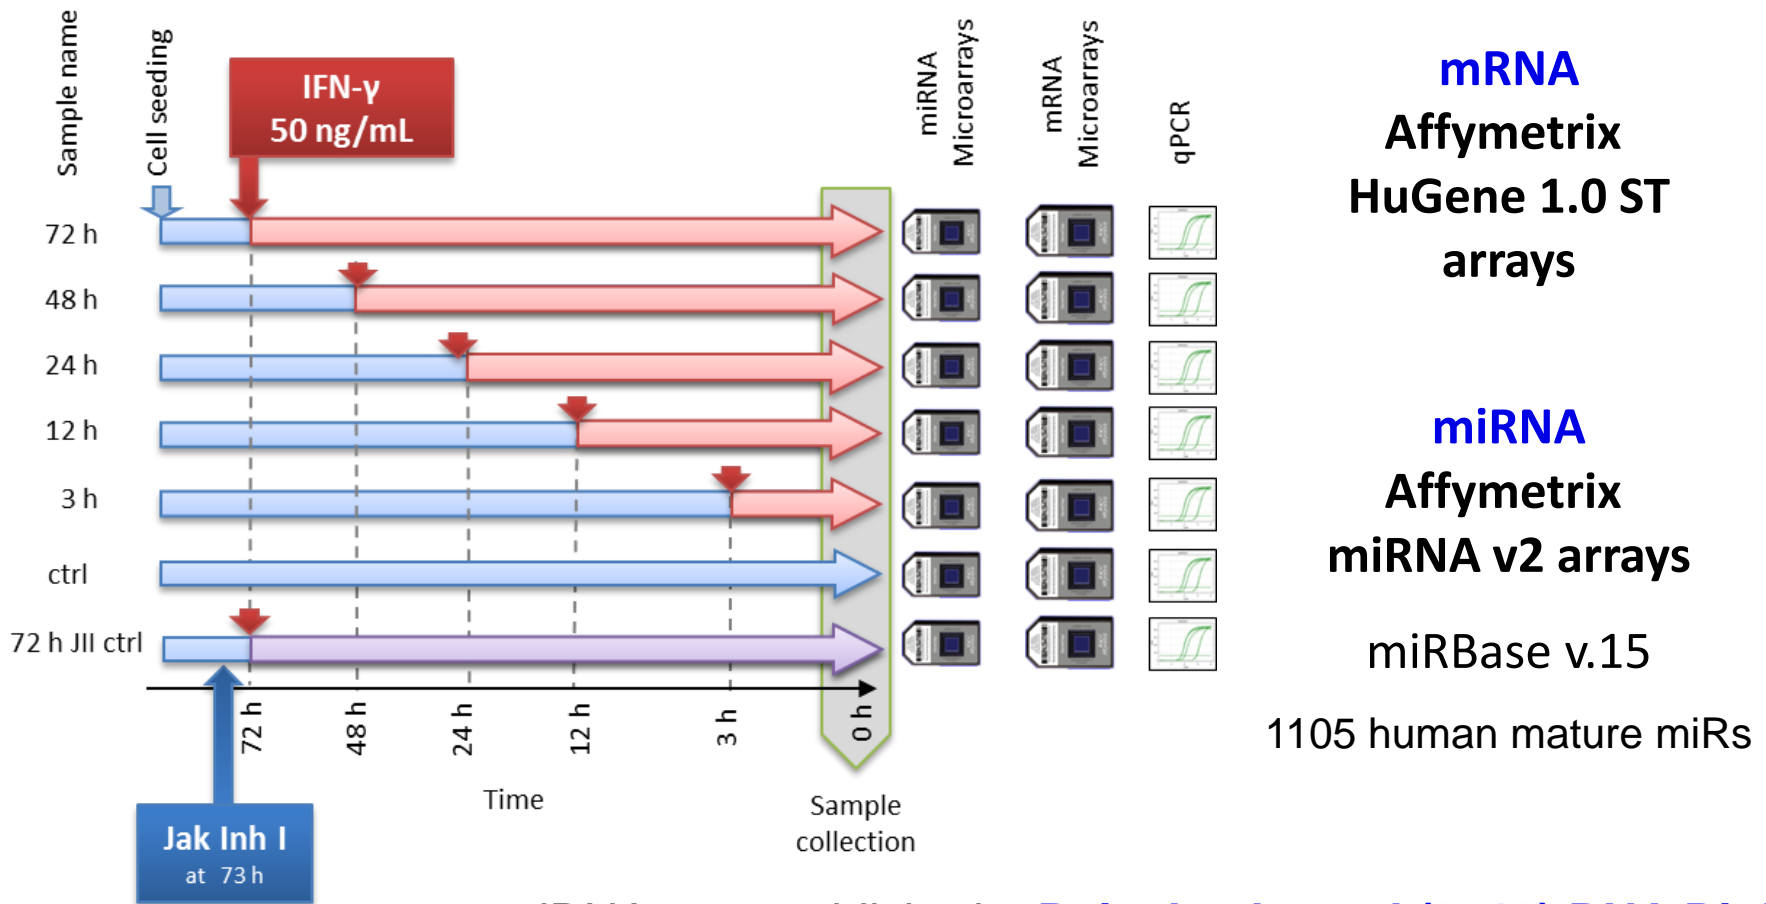

Understanding of mechanisms: cross-sectional studies may not provide enough information (cause-response problem), therefore **dynamic regulation of miRNA expression** changes have to be considered to answer this question.

The aim of the our study was to integrate time-resolved **miRNA, mRNA** data and existing **knowledge** about their interaction and functions in order to obtain new information about biological processes.

- ◆ Find robust list of miRNA-targeted genes: miR -| mRNA
- ◆ Compose/verify a pipeline for analysis of time-resolved MA data
- ◆ Investigate dynamics of active biological functions in IFN γ -stimulated melanoma cell line
- ◆ Integrate miRNA, mRNA and inferred upstream transcription regulators
- ◆ Detect topological motifs in regulation network

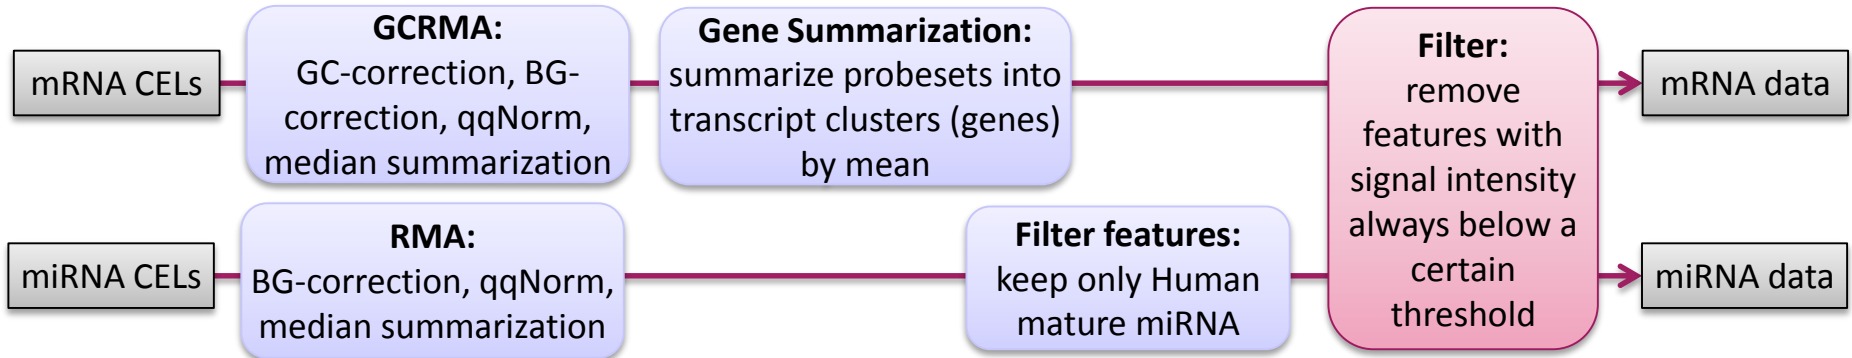

Human melanoma **A375** cells were seeded together and cultured until sample collection. Cells were IFN γ stimulated at different time points.

miRNA story published: [Reinsbach, et al \(2012\) RNA Biology](#)

Standard pre-processing scheme was used in **Partek® GS** (alternatively one can use APT)

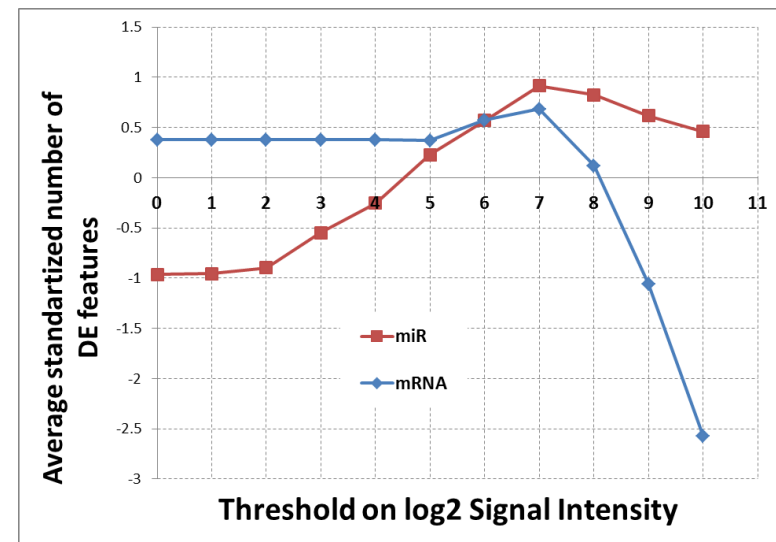

It can be beneficial to remove lowly expressed features

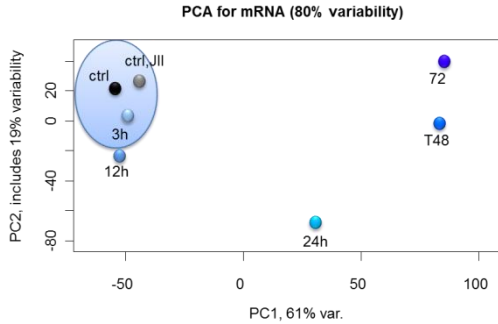

Features with expression (log2 signal intensity) constantly below a certain threshold may be removed.

1. This improves number of significant DEG
2. and improves qPCR validation afterwards.

Based on these profiles and our previous experience we selected **threshold = 7**

PCA: DATA OVERVIEW

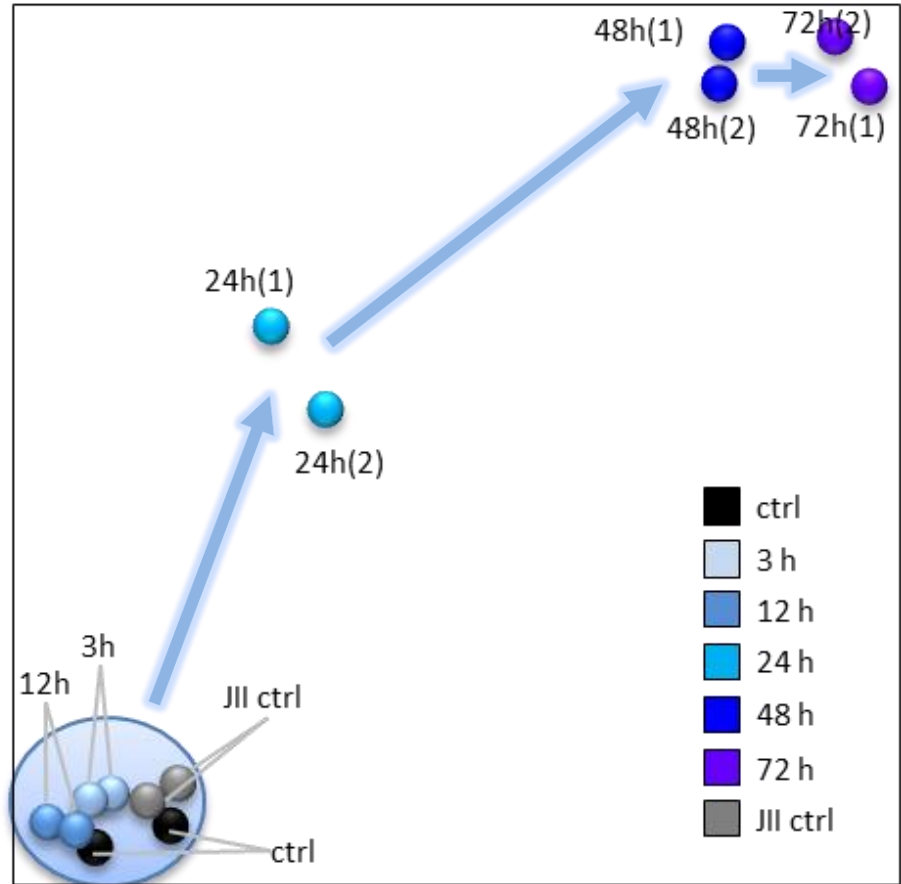

PC₁ of mRNA

First principal component of mRNAs,
39% of variability

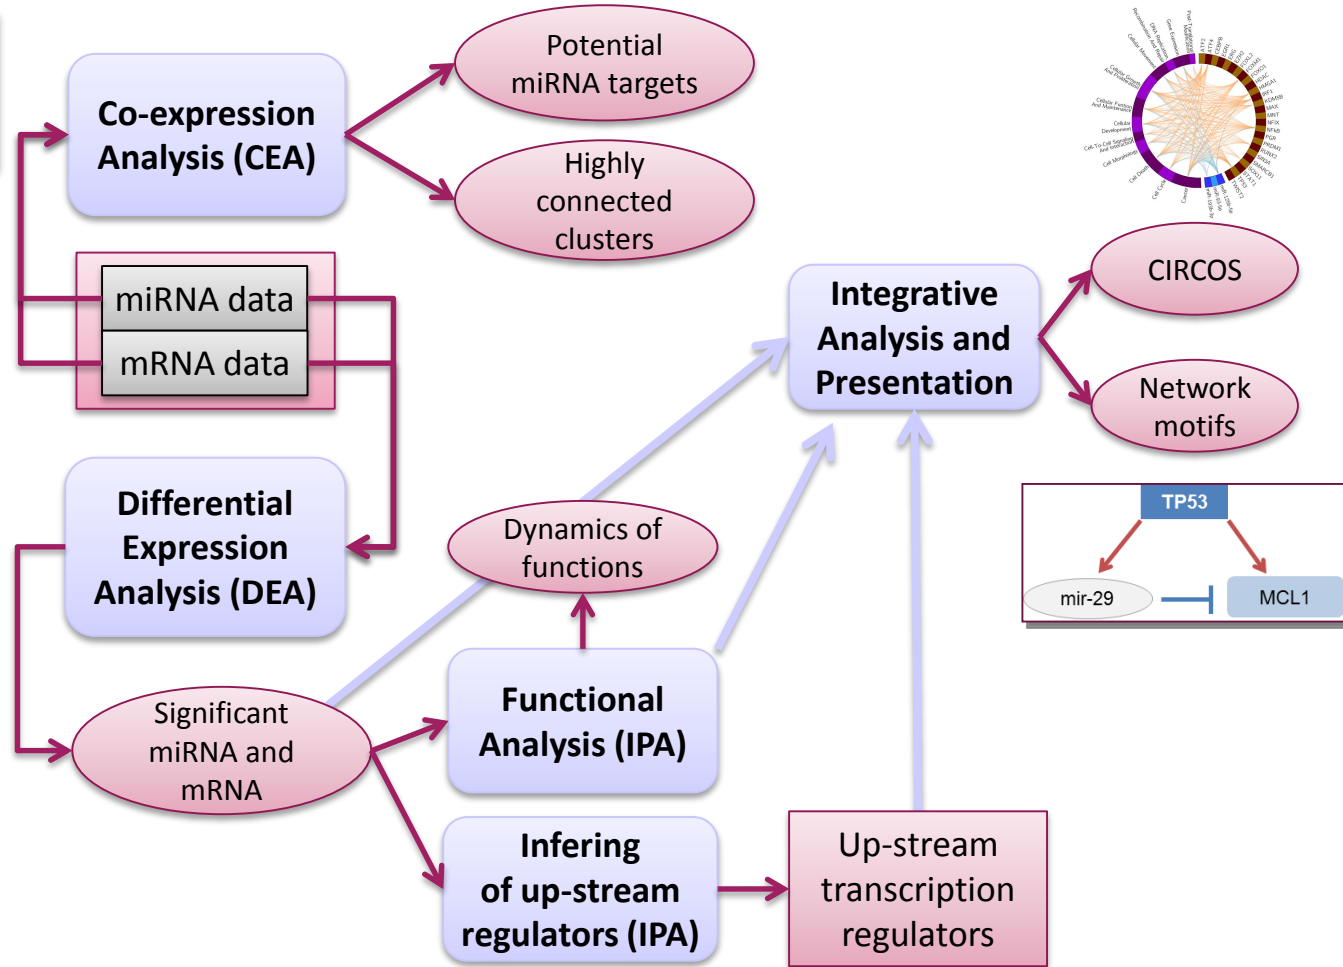

PC₁ of miR

ANALYSIS PIPELINE

◆ Analysis was performed using a user-friendly tool CoExpress:

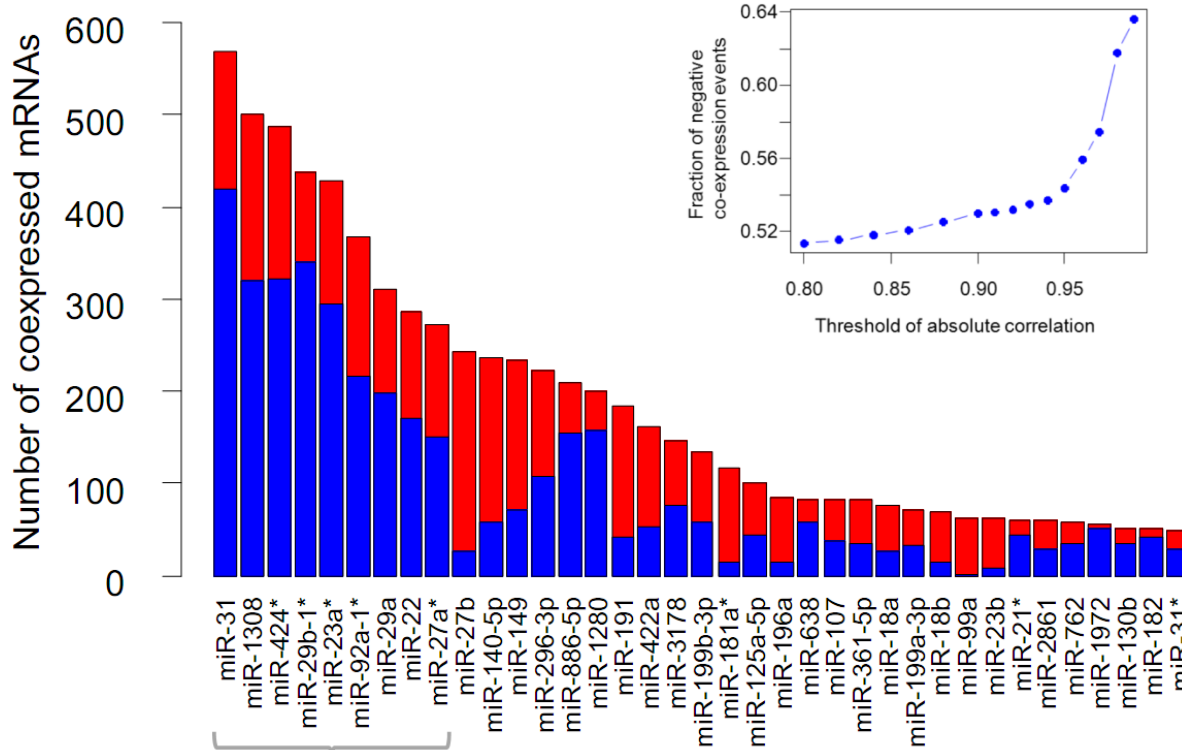

<http://www.bioinformatics.lu/CoExpress/>

◆ Analysis was performed using a user-friendly tool **CoExpress**:

<http://www.bioinformatics.lu/CoExpress/>

Top co-expressed miRNAs:

Negative miRNA:mRNA correlations exceed positive ones

<http://www.bioinformatics.lu/CoExpress/>

Because of the lack of independent points we cannot use co-expression as a discovery tool. **However CE analysis can be combined with existing knowledge:**

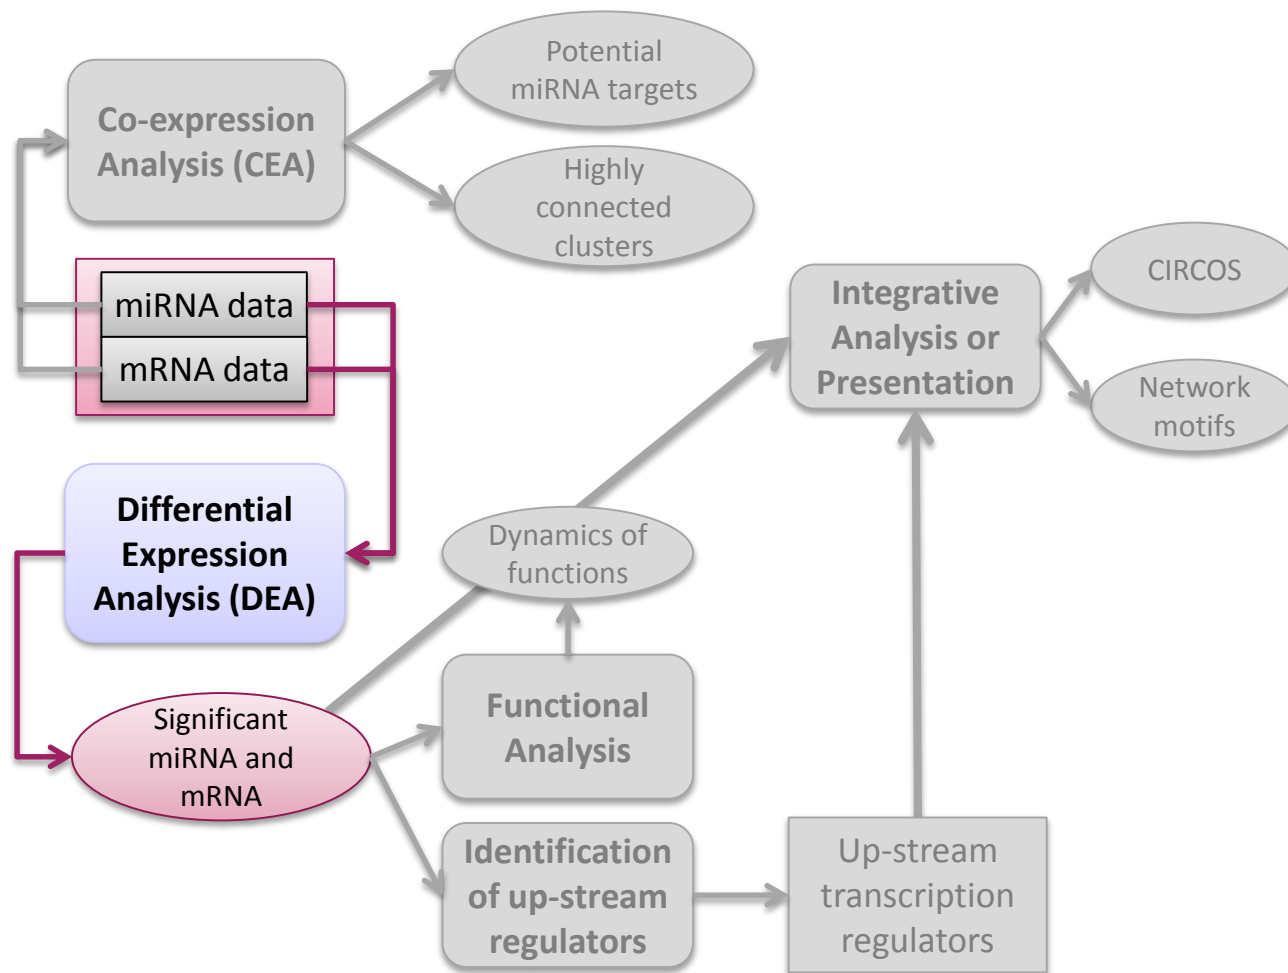

TargetScan ,
TarBase,
etc...

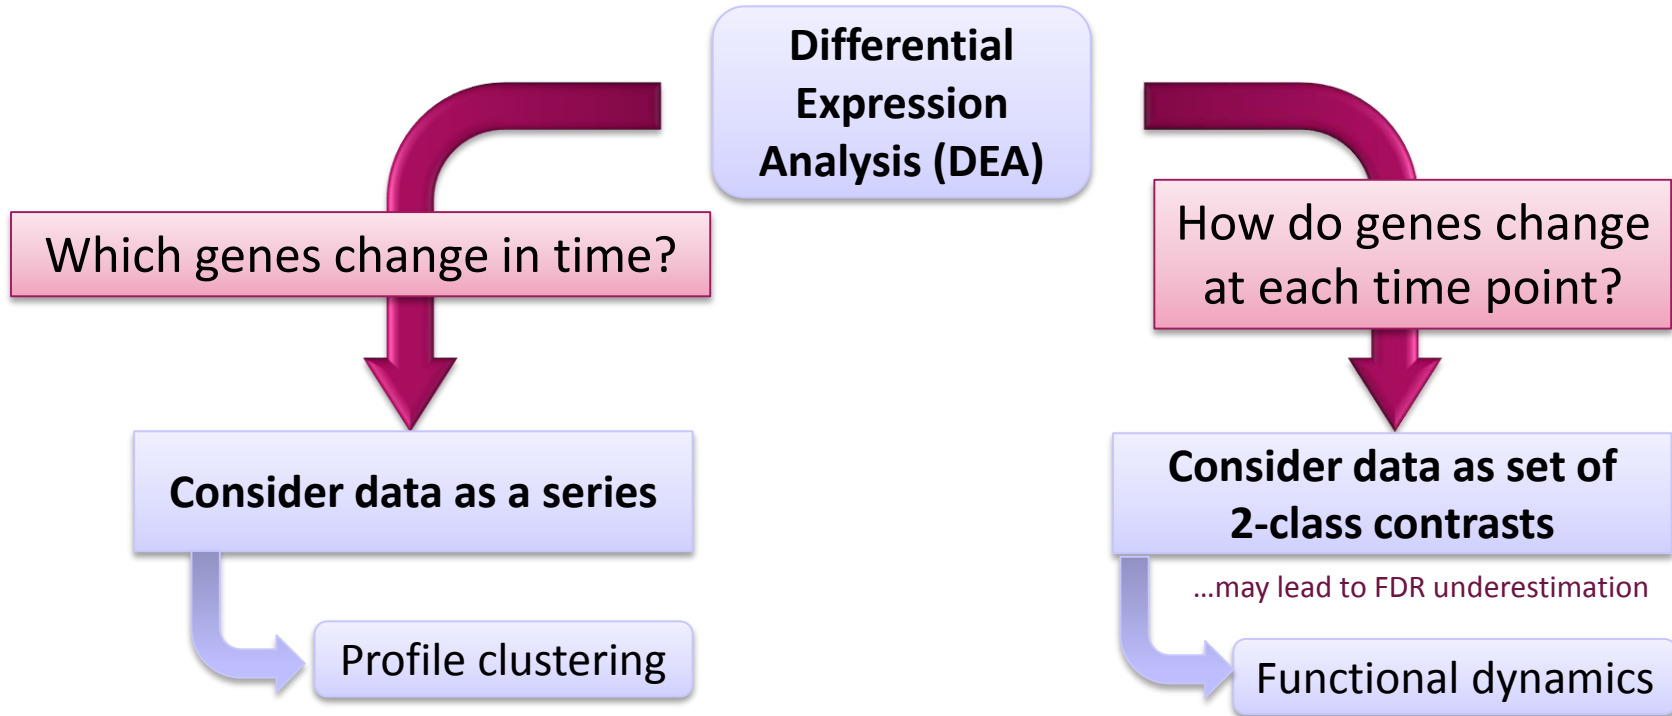

Use known or predicted interactions to filter observed negatively correlated miRNA:mRNA pairs

List of high quality miRNA-targets

TargetScan v6: we observed **398** predicted miRNA – | mRNA interactions (with $r < -0.9$)

TarBase v6: we observed **17** known miRNA – | mRNA interactions (with $r < -0.9$)

We tested several DEA methods, applicable for time course MA data

- ◆ **Limma** (linear models for microarray data) → Smyth, GK (2005). *Limma: linear models for microarray data*
- ◆ **BETR** (Bayesian Estimation of Temporal Regulation) → Aryee, MJ (2009) *BMC Bioinformatics*
- ◆ **timecourse** R-pkg (multivariate empirical Bayes models) → Tai YC, Speed TP (2006) *Annals of Statistics*

Data for Benchmarking

Datasets + 200 permutations:

Synthetic data

Synthetic data set consisted of 700 features.

- 350 of those represented **various profiles** (peak, smooth peak, steep regulation, smooth regulation, linear) mixed with normal noise in different proportions, so that average r^2 of profiles and noisy data varied between 0.999 and 0.5.
- Another 350 features were **completely random**.

FUNCTIONAL ANALYSIS

Using P-value and Z-score (only Top 50)

FDR \geq 0.01

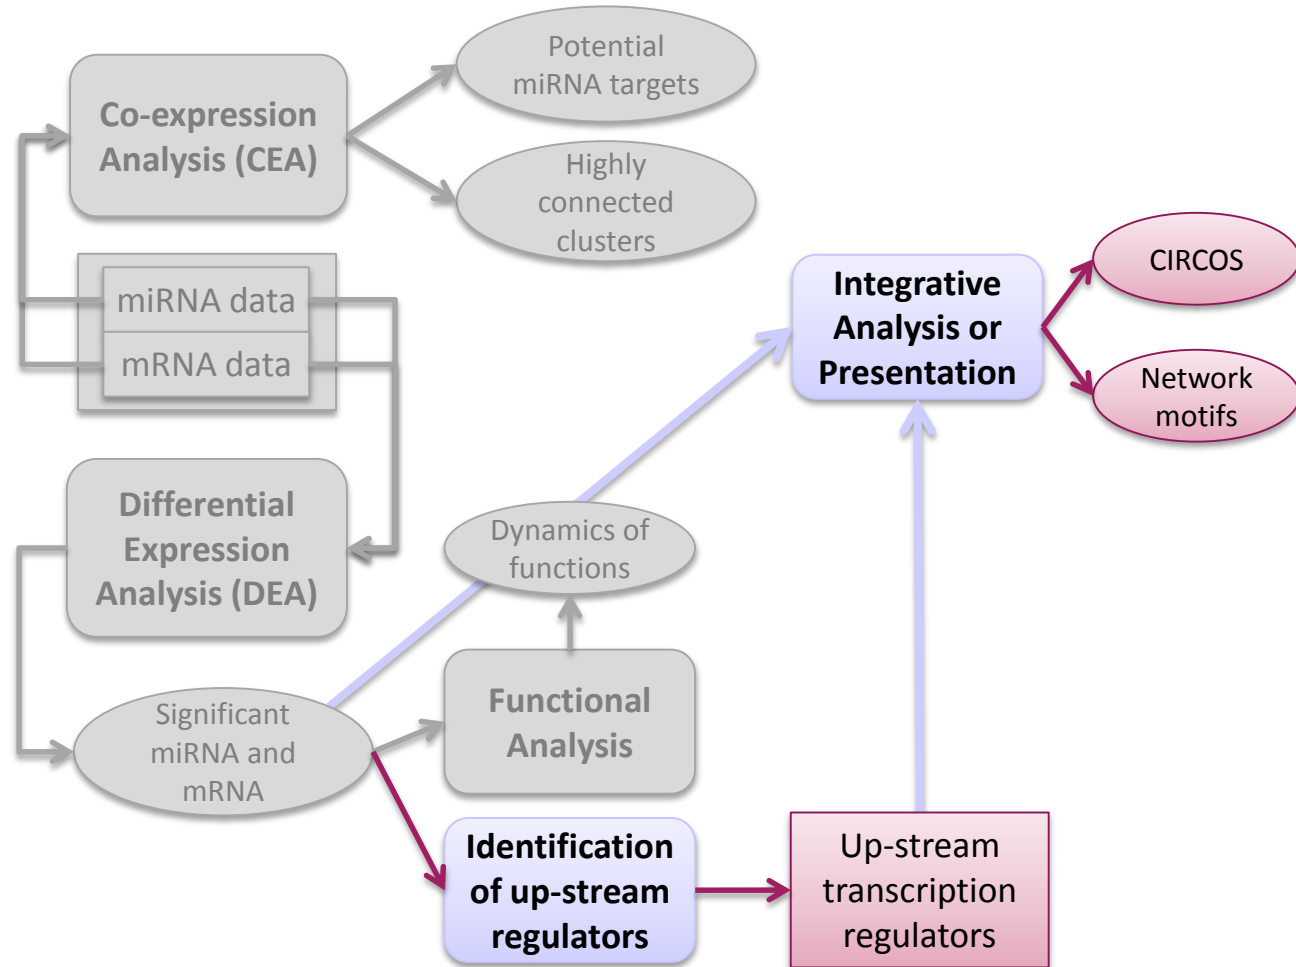

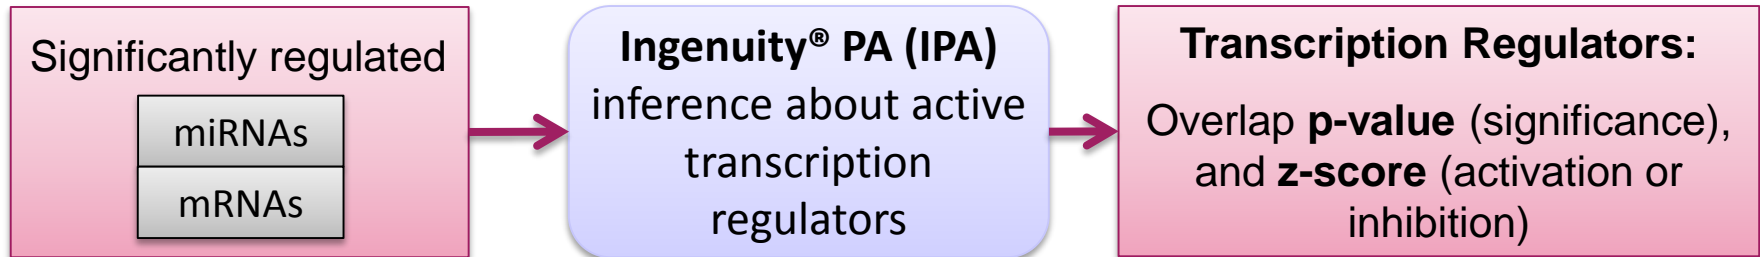

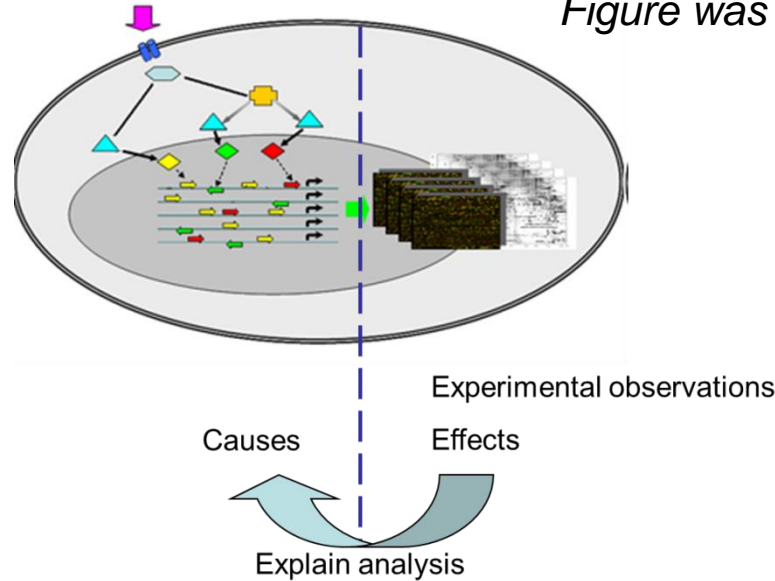

Figure was adapted from Explain Biobase

Importantly, inferred upstream regulators include: **miRNAs**, **TFs**, **kinases**, **chemical**, etc. Therefore we included protein level into our analysis.

1. Significantly expressed genes are combined into functional categories

2. miRNA targeting activated TR are selected

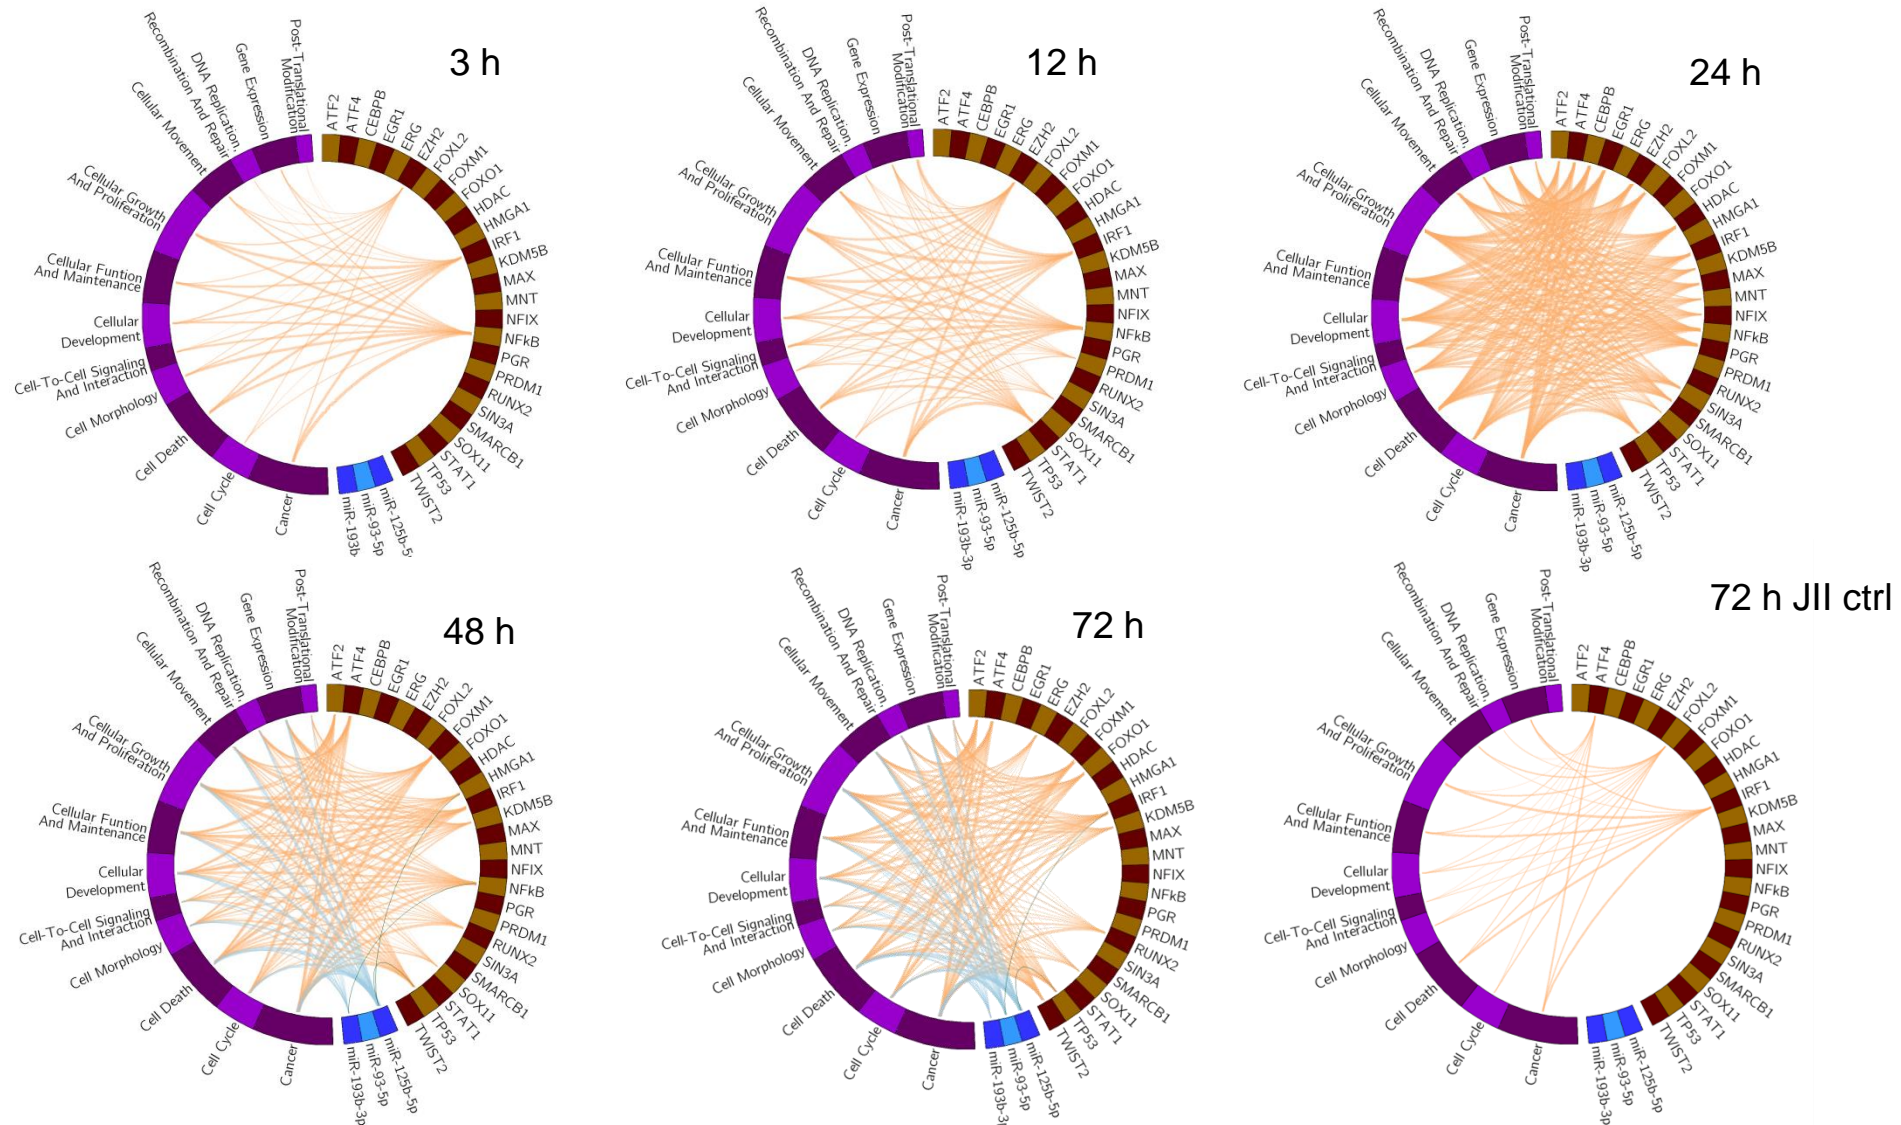

Connections show:

TR -> mRNA

miR -| TR

miR -| mRNA

Networks, interconnecting: genes, miRNAs and transcription factors (inferred by Ingenuity), were manually curated. We were able to identify several feed forward loops, presented below.

Biology

- ◆ We observed a delayed response of miRNA with respect to mRNA response to IFN γ stimulation
 - miRNA are involved in fine tuning and compensation
- ◆ Promising regulation motifs were detected

Analysis

- ◆ Pipeline for simultaneous analysis of time-resolved miRNA and mRNA data was validated
- ◆ We showed benefits of LIMMA and filtering of not expressed features: lower FP rate and higher number of SDE genes.
